What are the pros and cons of living in Australia?

Answer Request Follow 109 Comment Share 9 Downvote

I have studied, worked and lived in Australia as an Intern employee, business owner and a citizen.

I have experienced this country in all the ways possible, you However, I firmly believe that there are definitely more pros Australia but still I have mentioned below a few challenges and benefits.

Hope it helps! :)

Possible Challenges

- Language problem for those who don't speak English
- Not having your family and friends around could make society more and more connected and thanks to Social Media you can stay in touch a bit easier

epoch?

What if no event in one epoch?

What about time-related queries?

Outline of the Seminar

TEMPORAL POINT PROCESSES (TPPs):

- INTRO**
1. Intensity function
 2. Basic building blocks
 3. Superposition
 4. Marks and SDEs with jumps

Next

MODELS & INFERENCE

1. Modeling event sequences
2. Clustering event sequences
3. Capturing complex dynamics
4. Causal reasoning on event sequences

RL & CONTROL

1. Marked TPPs: a new setting
2. Stochastic optimal control
3. Reinforcement learning

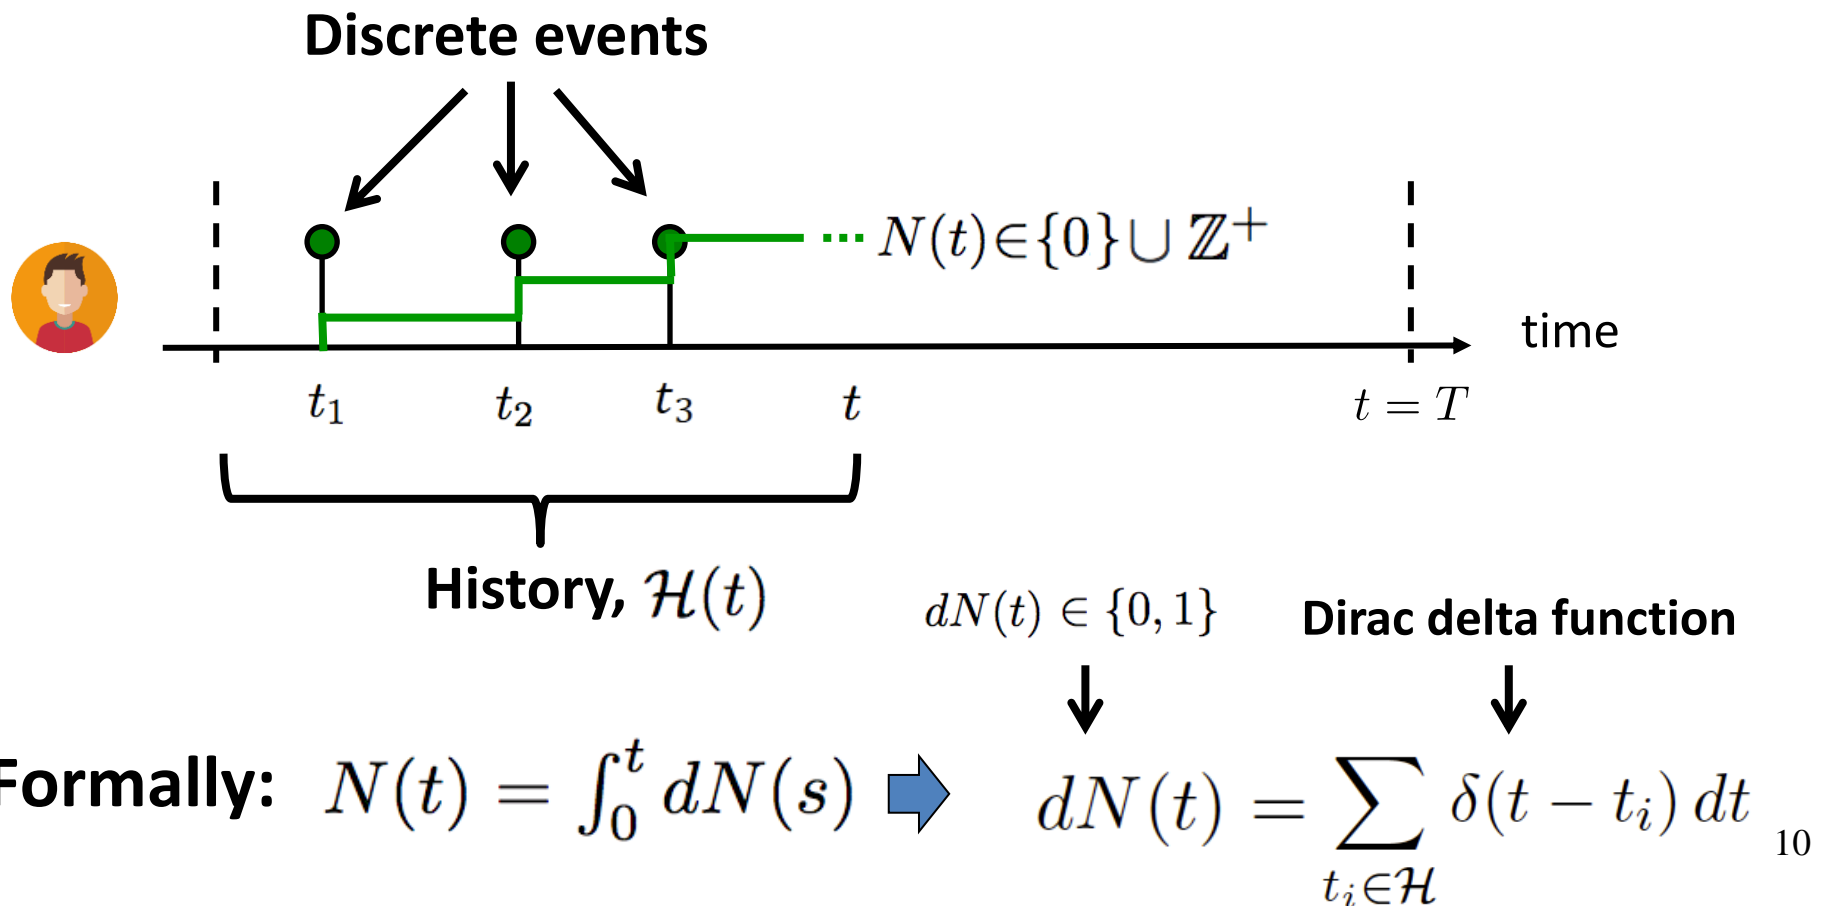

Temporal Point Processes (TPPs): Introduction

- 1. Intensity function**
2. Basic building blocks
3. Superposition
4. Marks and SDEs with jumps

Temporal point processes

Temporal point process:

A random process whose realization consists of discrete events localized in time $\mathcal{H} = \{t_i\}$

Model time as a random variable

Likelihood of a timeline: $f^*(t_1) f^*(t_2) f^*(t_3) f^*(t) S^*(T)$

Problems of density parametrization (I)

$$\begin{array}{ccccccc}
 f^*(t_1) & f^*(t_2) & f^*(t_3) & f^*(t) & S^*(T) & & \\
 \nearrow & \nearrow & \uparrow & \nwarrow & \nwarrow & & \\
 \frac{\exp\langle w, \psi^*(t_1) \rangle}{Z} & \frac{\exp\langle w, \psi^*(t_2) \rangle}{Z} & \frac{\exp\langle w, \psi^*(t_3) \rangle}{Z} & \frac{\exp\langle w, \psi^*(t) \rangle}{Z} & 1 - \int_t^T \frac{\exp\langle w, \psi^*(\tau) \rangle}{Z} d\tau & &
 \end{array}$$

It is **difficult for model design and interpretability**:

1. Densities need to integrate to 1 (i.e., partition function)
2. Difficult to combine timelines

Intensity function

Intensity:

Probability between $[t, t+dt)$ but not before t

$$\lambda^*(t)dt = \frac{f^*(t)dt}{S^*(t)} \geq 0 \quad \Rightarrow \quad \lambda^*(t)dt = \mathbb{E}[dN(t)|\mathcal{H}(t)]$$

Observation: $\lambda^*(t)$ It is a rate = # of events / unit of time

Advantages of intensity parametrization (I)

$$\lambda^*(t_1) \lambda^*(t_2) \lambda^*(t_3) \lambda^*(t) \exp \left(- \int_0^T \lambda^*(\tau) d\tau \right)$$

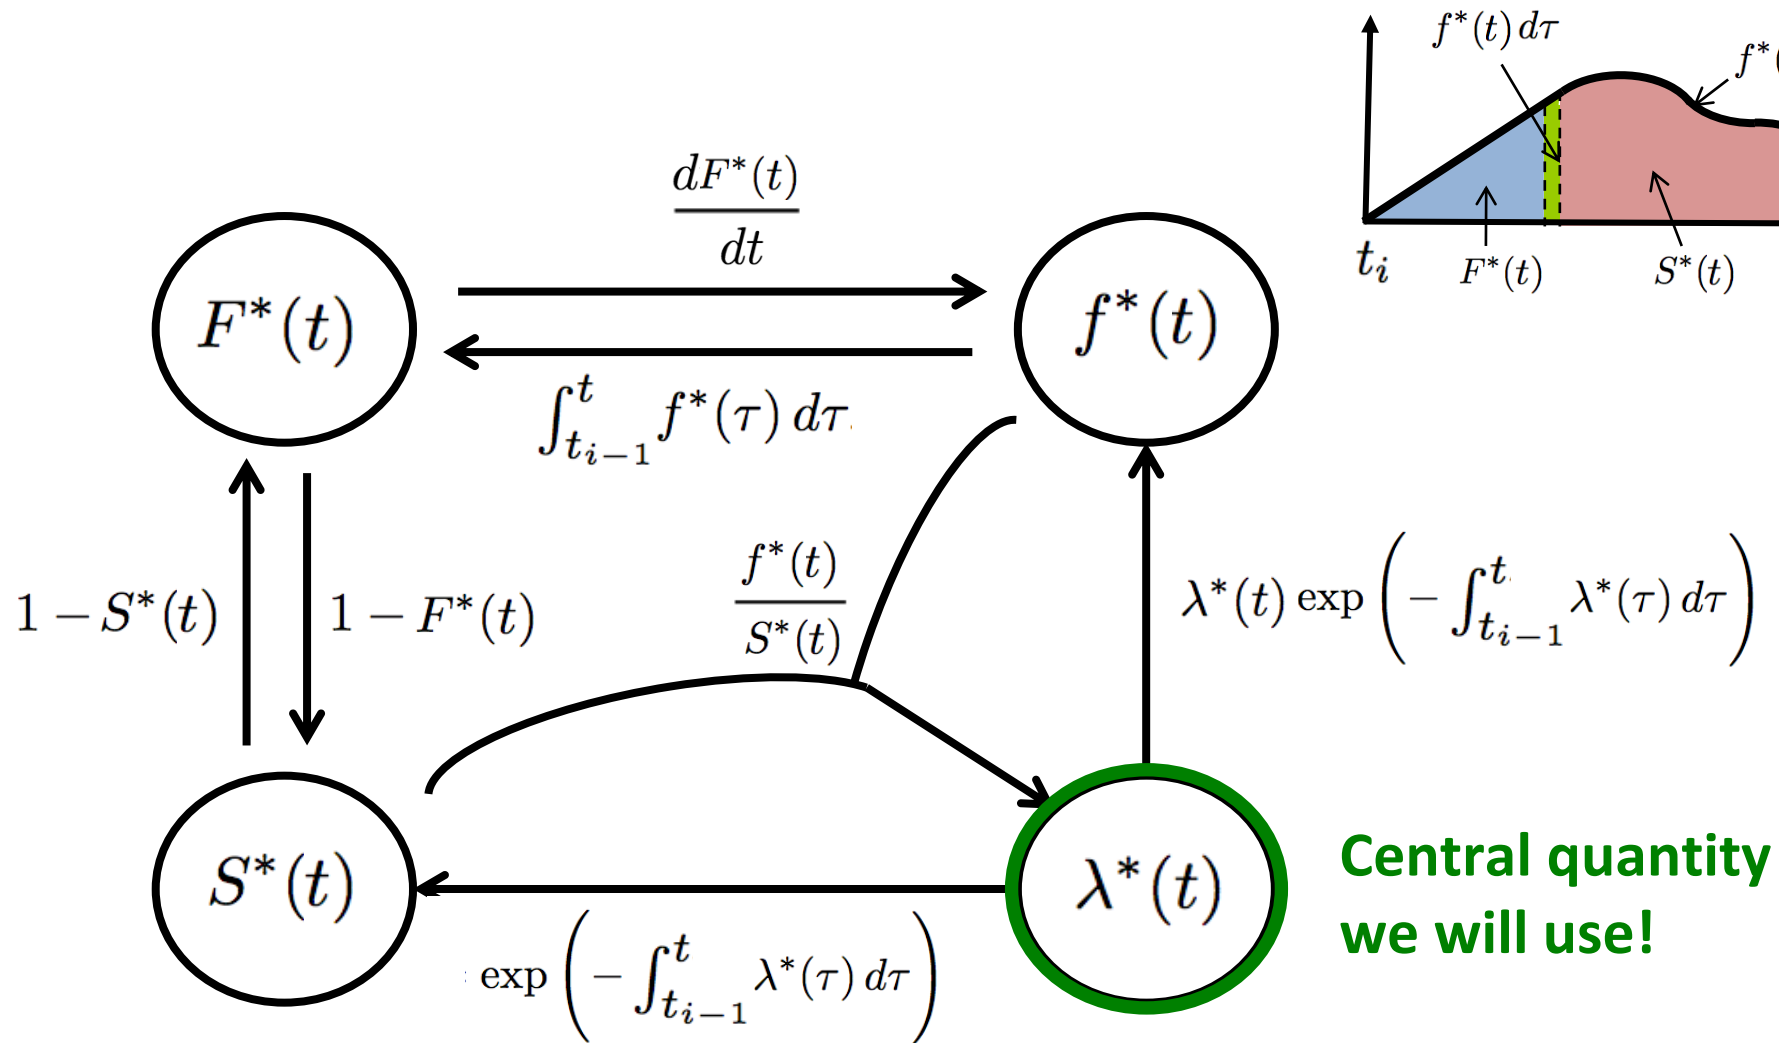

Arrows point from the following expressions to the corresponding terms in the equation above:

- $\langle w, \phi^*(t_1) \rangle$ points to $\lambda^*(t_1)$
- $\langle w, \phi^*(t_2) \rangle$ points to $\lambda^*(t_2)$
- $\langle w, \phi^*(t_3) \rangle$ points to $\lambda^*(t_3)$
- $\langle w, \phi^*(t) \rangle$ points to $\lambda^*(t)$
- $\exp \left(- \int_0^T \langle w, \phi^*(\tau) \rangle d\tau \right)$ points to the exponential term

Suitable for model design and interpretable:

1. Intensities only need to be nonnegative
2. Easy to combine timelines

Relation between f^* , F^* , S^* , λ^*

Representation:

Temporal Point Processes

1. Intensity function
- 2. Basic building blocks**
3. Superposition
4. Marks and SDEs with jumps

Poisson process

Intensity of a Poisson process

$$\lambda^*(t) = \mu$$

Observations:

1. Intensity independent of history
2. Uniformly random occurrence
3. Time interval follows exponential distribution

Fitting & sampling from a Poisson

Fitting by maximum likelihood:

$$\mu^* = \operatorname{argmax}_{\mu} 3 \log \mu - \mu T = \frac{3}{T}$$

Sampling using inversion sampling:

$$t \sim \underbrace{\mu \exp(-\mu(t - t_3))}_{f_t^*(t)} \quad \Rightarrow \quad t = \underbrace{-\frac{1}{\mu} \log(1 - u)}_{F_t^{-1}(u)} + t_3$$

$\text{Uniform}(0, 1)$
 \downarrow
 u

Inhomogeneous Poisson process

Intensity of an inhomogeneous Poisson process

$$\lambda^*(t) = g(t) \geq 0 \quad (\text{Independent of history})$$

Example:

Fitting & sampling from inhomogeneous Poisson

Fitting by maximum likelihood: $\underset{g(t)}{\text{maximize}} \sum_{i=1}^n \log g(t_i) - \int_0^T g(\tau) d\tau.$

Sampling using thinning (reject. sampling) + inverse sampling:

1. Sample t from Poisson process with intensity μ using inverse sampling
 2. Generate $u_2 \sim \text{Uniform}(0, 1)$
 3. Keep the sample if $u_2 \leq g(t) / \mu$
- } Keep sample with prob. $g(t) / \mu$

Terminating (or survival) process

Intensity of a terminating (or survival) process

$$\lambda^*(t) = g^*(t)(1 - N(t)) \geq 0$$

Observations:

1. Limited number of occurrences

*Try sampling
and fitting!*

Self-exciting (or Hawkes) process

Intensity of self-exciting
(or Hawkes) process:

$$\begin{aligned}\lambda^*(t) &= \mu + \alpha \sum_{t_i \in \mathcal{H}(t)} \kappa_\omega(t - t_i) \\ &= \mu + \alpha \kappa_\omega(t) \star dN(t)\end{aligned}$$

Observations:

1. Clustered (or bursty) occurrence of events
2. Intensity is stochastic and history dependent

Fitting a Hawkes process from a recorded timeline

Fitting by maximum likelihood:

$$\text{maximize}_{\mu, \alpha} \left\{ \sum_{i=1}^n \log \lambda^*(t_i) - \int_0^T \lambda^*(\tau) d\tau \right\} \quad \left. \begin{array}{l} \text{The max. likelihood} \\ \text{is jointly convex} \\ \text{in } \mu \text{ and } \alpha \end{array} \right\}$$

Sampling using thinning (reject. sampling) + inverse sampling:

Key idea: the maximum of the intensity λ_0 changes over time

Summary

Building blocks to represent different dynamic processes:

Poisson processes:

$$\lambda^*(t) = \lambda$$

Inho

Term

**We know how to fit them
and how to sample from them**

$$\lambda^*(t) = g(t)(1 - IV(t))$$

Self-exciting point processes:

$$\lambda^*(t) = \mu + \alpha \sum_{t_i \in \mathcal{H}(t)} \kappa_\omega(t - t_i)$$

Representation:

Temporal Point Processes

1. Intensity function
2. Basic building blocks
- 3. Superposition**
4. Marks and SDEs with jumps

Mutually exciting process

Clustered occurrence affected by neighbors

$$\lambda^*(t) = \mu + \alpha \sum_{t_i \in \mathcal{H}_b(t)} \kappa_\omega(t - t_i) + \beta \sum_{t_i \in \mathcal{H}_c(t)} \kappa_\omega(t - t_i)$$

Mutually exciting terminating process

Clustered occurrence affected by neighbors

$$\lambda^*(t) = (1 - N(t)) \left(g(t) + \beta \sum_{t_i \in \mathcal{H}_c(t)} \kappa_\omega(t - t_i) \right)$$

Representation:

Temporal Point Processes

1. Intensity function
2. Basic building blocks
3. Superposition
- 4. Marks and SDEs with jumps**

Marked temporal point processes

Marked temporal point process:

A random process whose realization consists of **discrete marked events localized in time**

Independent identically distributed marks

Distribution for the marks:

$$x^*(t_i) \sim p(x)$$

Observations:

1. Marks independent of the temporal dynamics
2. Independent identically distributed (I.I.D.)

Dependent marks: SDEs with jumps

Marks given by stochastic differential equation with jumps:

$$x(t + dt) - x(t) = dx(t) = \underbrace{f(x(t), t)dt}_{\text{Drift}} + \underbrace{h(x(t), t)dN(t)}_{\text{Event influence}}$$

Observations:

1. Marks dependent of the temporal dynamics
2. Defined for all values of t

Dependent marks: distribution + SDE with jumps

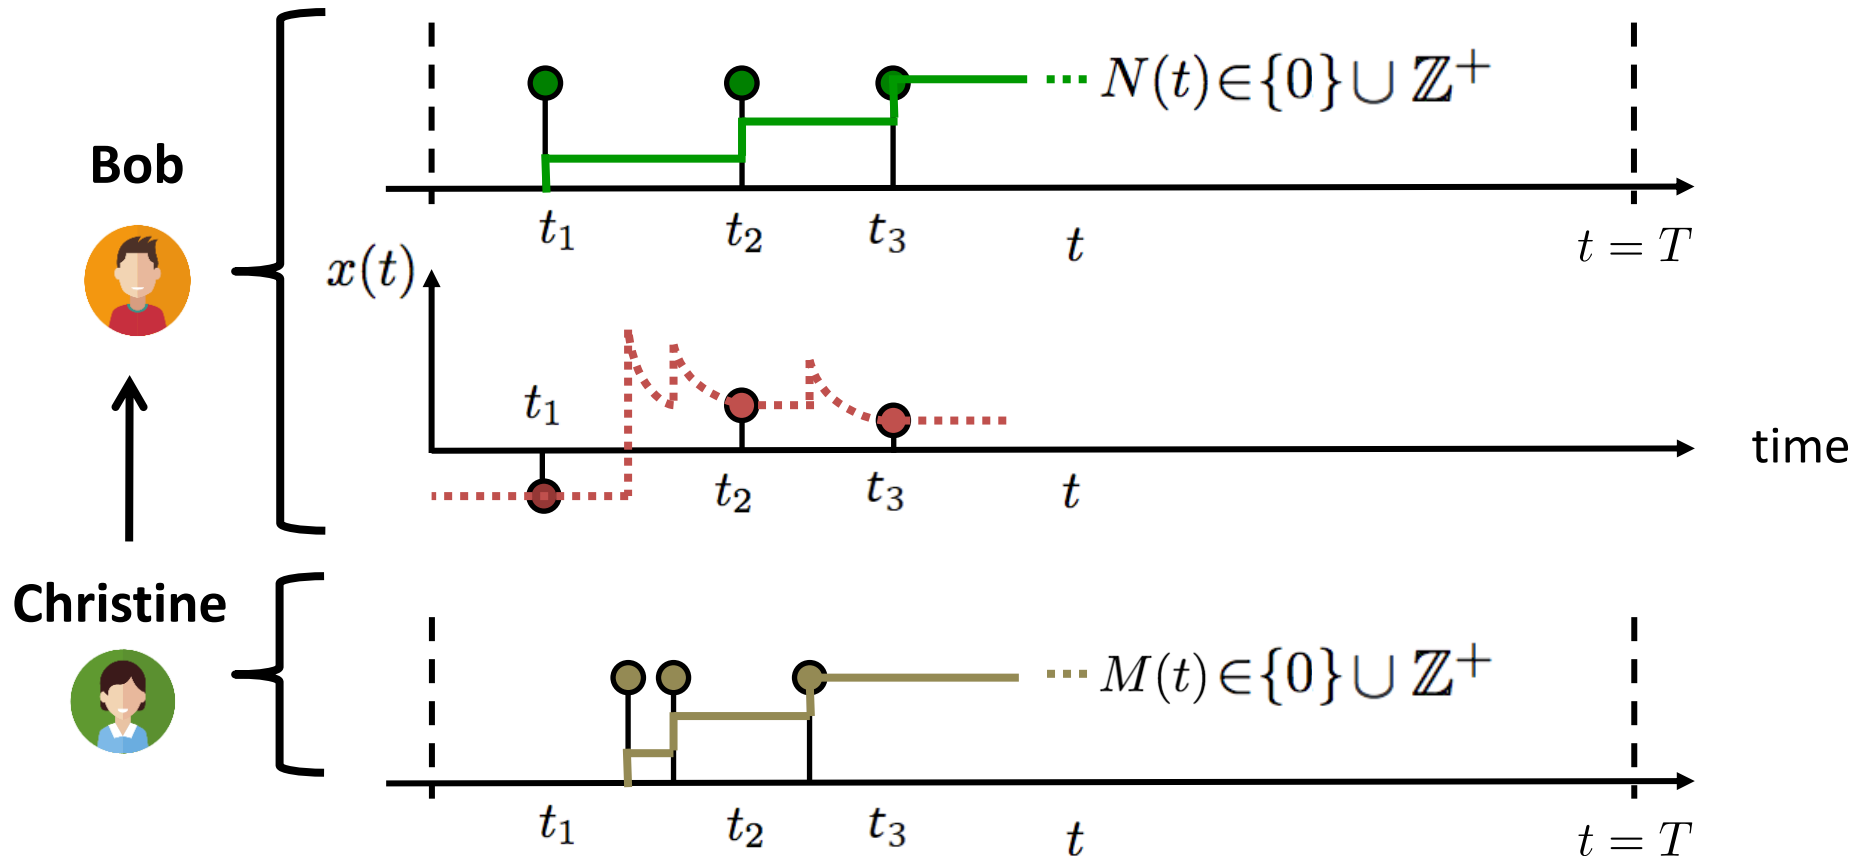

Distribution for the marks:

$$x^*(t_i) \sim p(x^* | x(t)) \Rightarrow dx(t) = \underbrace{f(x(t), t)dt}_{\text{Drift}} + \underbrace{h(x(t), t)dN(t)}_{\text{Event influence}}$$

Observations:

1. Marks dependent on the temporal dynamics
2. Distribution represents additional source of uncertainty

Mutually exciting + marks

Marks affected by neighbors

$$dx(t) = \underbrace{f(x(t), t)dt}_{\text{Drift}} + \underbrace{g(x(t), t)dM(t)}_{\text{Neighbor influence}}$$

Marked TPPs as stochastic dynamical systems

Example: Susceptible-Infected-Susceptible (SIS)

SDE with jumps

$$dX_i(t) = \underbrace{dY_i(t)}_{\text{It gets infected}} - \underbrace{dW_i(t)}_{\text{It recovers}}$$

Node is susceptible

$$\lambda_{Y_i}(t)dt = (1 - X_i(t))\beta \underbrace{\sum_{j \in \mathcal{N}(i)} X_j(t)}_{\text{If friends are infected, higher infection rate}}dt$$

SDE with jumps

$$d\lambda_{W_i}(t) = \underbrace{\delta dY_i(t)}_{\text{Self-recovery rate when node gets infected}} - \underbrace{\lambda_{W_i}(t)dW_i(t)}_{\text{If node recovers, rate to zero}} + \underbrace{\rho dN_i(t)}_{\text{Rate increases if node gets treated}}$$
